

Model Explainability Report

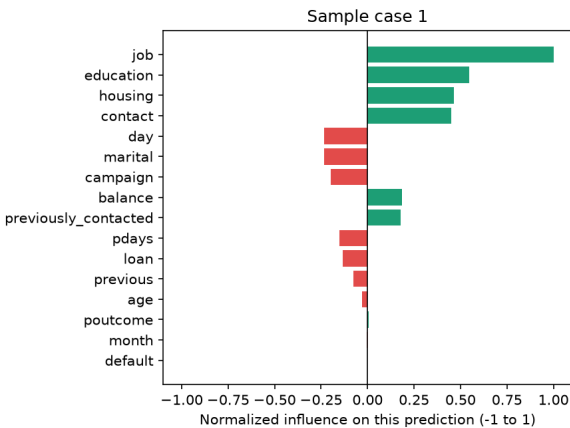

Model tested	Bank Marketing - 2-layer ANN
Endpoint	http://0.0.0.0:8000/bank_marketing
Task type	classification
Data points analyzed	50
Report generated	2026-09-15 19:01

A sensitivity score indicates how strongly each factor influences the model's output; a higher score means that factor has a bigger effect on the prediction. The scores provided below are normalized to a 0-1 scale, representing each feature's share of total measured sensitivity.

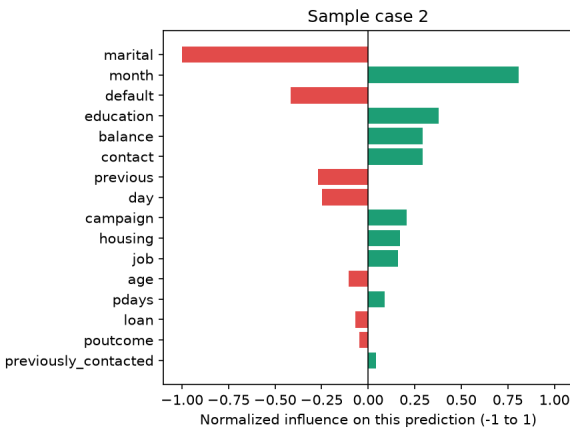

Feature sensitivity

The following examples illustrate specific real scenarios and highlight what most influenced each prediction made by the model.

Input values:

- age: 29.00

Input values:

- age: 47.00

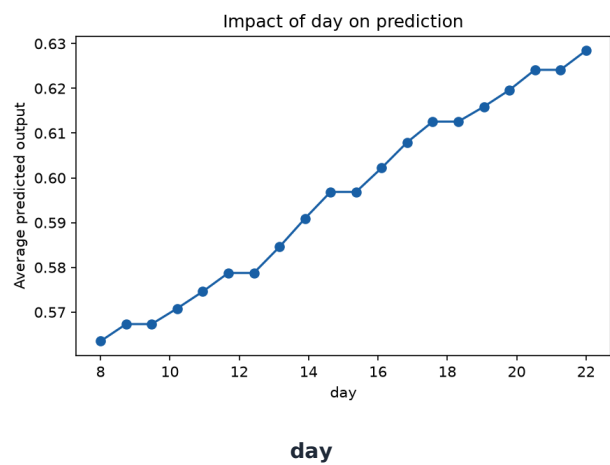

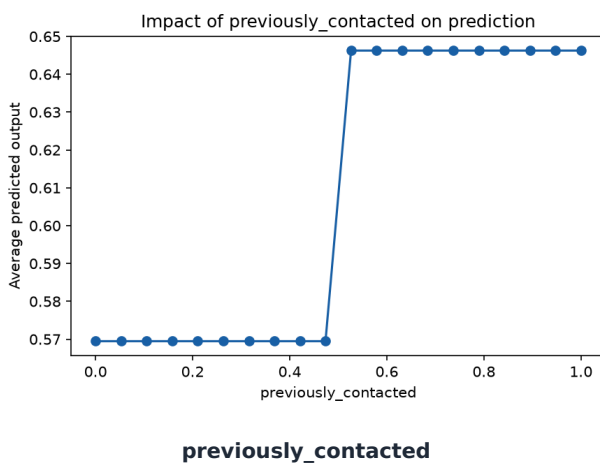

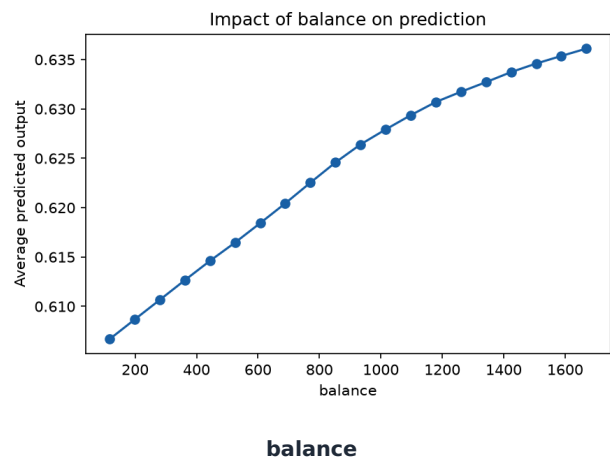

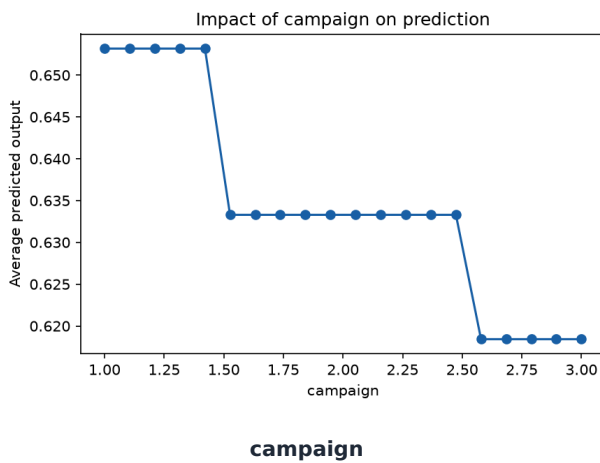

- **balance:** 1,200.00
- **day:** 5.00
- **campaign:** 2.00
- **pdays:** 10.00
- **previous:** 1.00
- **previously_contacted:** 0.00
- **job:** blue-collar
- **marital:** single
- **education:** secondary
- **default:** no
- **housing:** yes
- **loan:** no
- **contact:** cellular
- **month:** jan
- **poutcome:** success

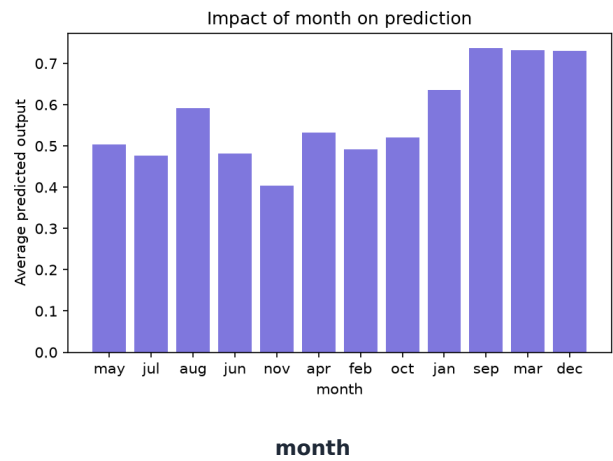

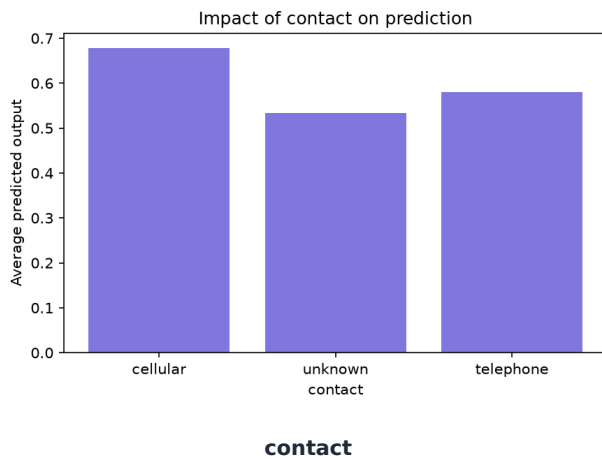

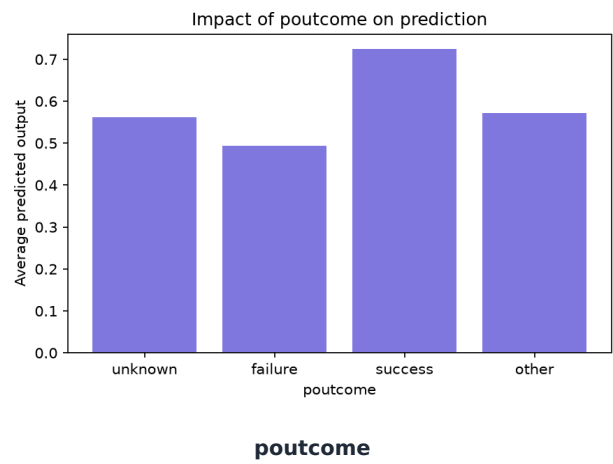

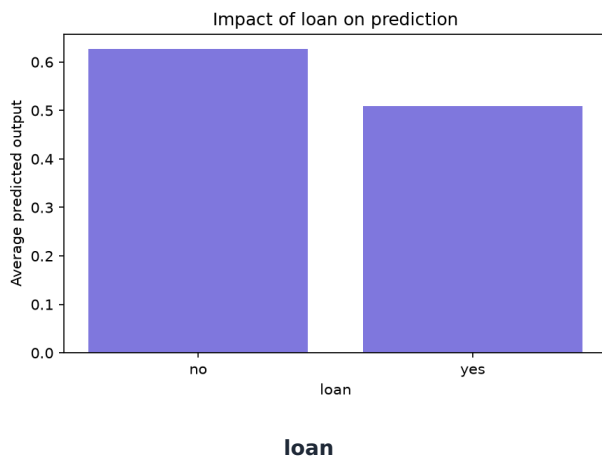

Predicted probability: 0.998

- **balance:** 5,000.00
- **day:** 10.00
- **campaign:** 3.00
- **pdays:** 30.00
- **previous:** 0.00
- **previously_contacted:** 0.00
- **job:** management
- **marital:** married
- **education:** secondary
- **default:** yes
- **housing:** no
- **loan:** yes
- **contact:** telephone
- **month:** mar
- **poutcome:** failure

Predicted probability: 0.859

The charts below demonstrate how the predicted output changes as each factor varies, while other factors remain typical of the dataset.

These results should be used as a starting point for review and further analysis, rather than a final verdict on the model's performance.
