

Model Explainability Report

Model tested	Bank Marketing - Logistic Regression
Endpoint	http://0.0.0.0:8000/bank_marketing
Task type	classification
Data points analyzed	50
Report generated	2026-09-15 18:48

A sensitivity score indicates how much each factor affects the model’s predictions. A higher score signifies a greater influence on the outcome. The scores presented here are normalized on a scale of 0 to 1, reflecting the relative importance of each feature in contributing to the model’s predictions.

Feature sensitivity

The following examples illustrate specific real scenarios and highlight what factors most influenced each prediction.

Input values:

- age: 34.00

Input values:

- age: 29.00

- **balance:** 12,893.00
- **day:** 21.00
- **campaign:** 1.00
- **pdays:** 12.00
- **previous:** 1.00
- **previously_contacted:** 0.00
- **job:** services
- **marital:** single
- **education:** tertiary
- **default:** no
- **housing:** yes
- **loan:** no
- **contact:** cellular
- **month:** may
- **poutcome:** success

Predicted probability: 0.785

- **balance:** 2,500.00
- **day:** 8.00
- **campaign:** 1.00
- **pdays:** 120.00
- **previous:** 0.00
- **previously_contacted:** 0.00
- **job:** services
- **marital:** divorced
- **education:** primary
- **default:** no
- **housing:** yes
- **loan:** no
- **contact:** cellular
- **month:** nov
- **poutcome:** unknown

Predicted probability: 0.382

The charts below demonstrate how variations in each factor can lead to changes in the predicted output, while keeping other factors consistent with typical values from the dataset.

These results should be considered a starting point for review and discussion, rather than a definitive conclusion.
