

# Model Explainability Report

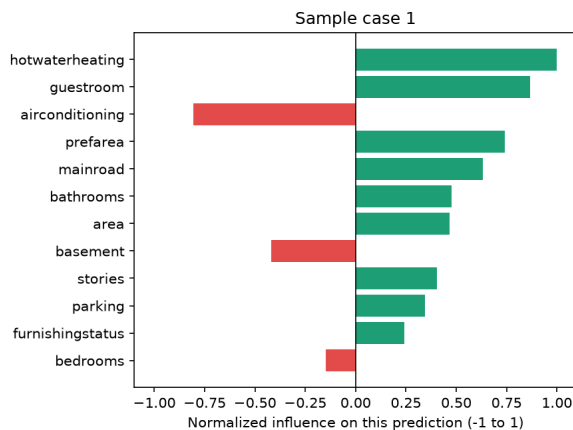

|                      |                                  |
|----------------------|----------------------------------|
| Model tested         | House Price - 2-layer ANN        |
| Endpoint             | http://0.0.0.0:8000/house_prices |
| Task type            | regression                       |
| Data points analyzed | 50                               |
| Report generated     | 2026-09-15 18:29                 |

A sensitivity score shows how strongly each factor influences the model's output; a higher score means that factor has a bigger effect on the prediction. The scores are normalized to a 0-1 scale representing each feature's share of total measured sensitivity.

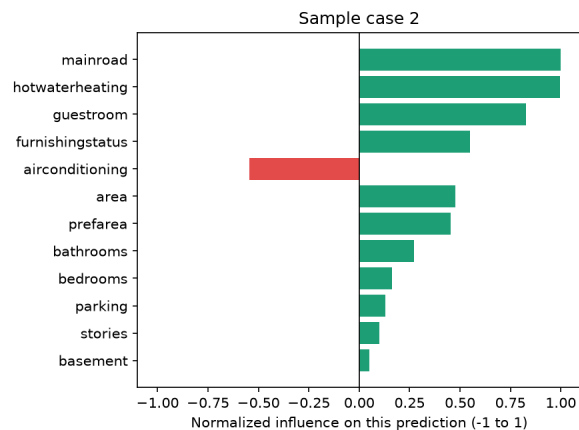

## Feature sensitivity

The following examples show specific real scenarios and what most influenced each prediction.

### Input values:

- area: 3,920.00
- bedrooms: 3.00
- bathrooms: 2.00

### Input values:

- area: 7,487.00
- bedrooms: 3.00
- bathrooms: 2.00

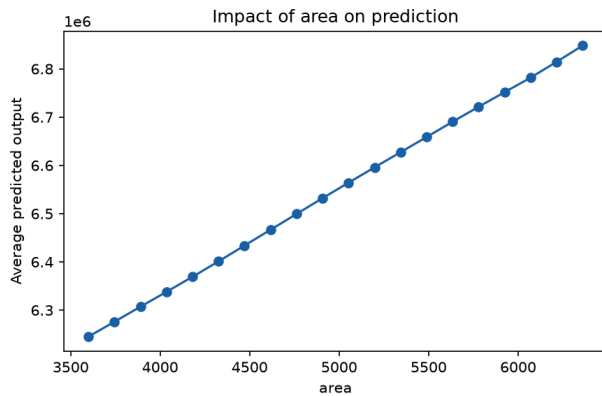

- **stories:** 2.00
- **parking:** 1.00
- **mainroad:** yes
- **guestroom:** no
- **basement:** no
- **hotwaterheating:** yes
- **airconditioning:** no
- **prefarea:** yes
- **furnishingstatus:** furnished

**Predicted value:** 6,357,290.80

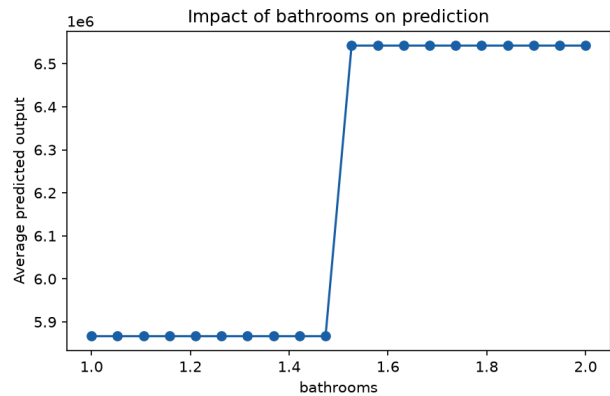

- **stories:** 1.00
- **parking:** 1.00
- **mainroad:** yes
- **guestroom:** no
- **basement:** yes
- **hotwaterheating:** yes
- **airconditioning:** no
- **prefarea:** yes
- **furnishingstatus:** furnished

**Predicted value:** 7,525,502.54

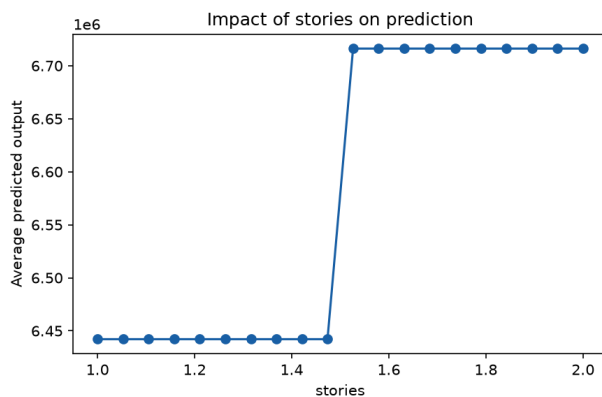

The charts below show how the predicted output changes as each factor varies, while other factors remain typical of the dataset.

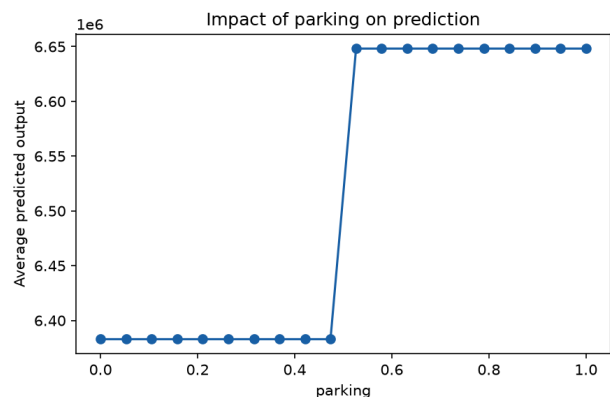

**area**

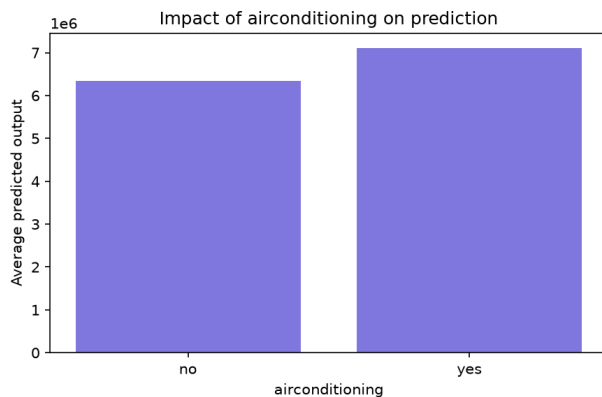

**bathrooms**

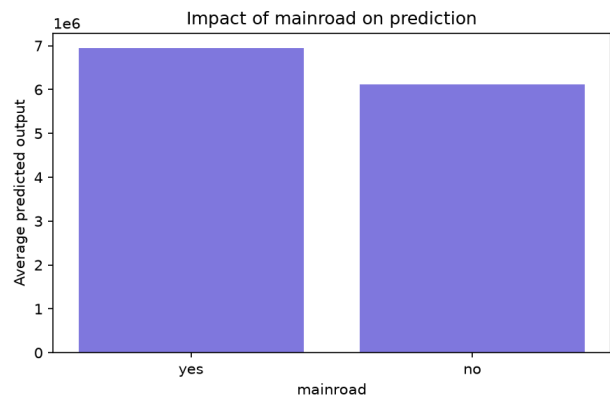

**stories**

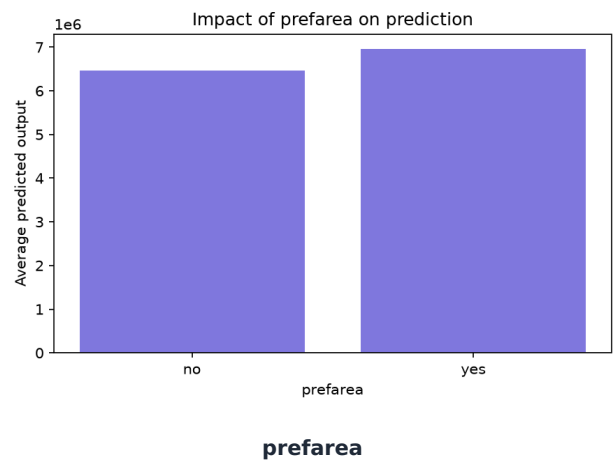

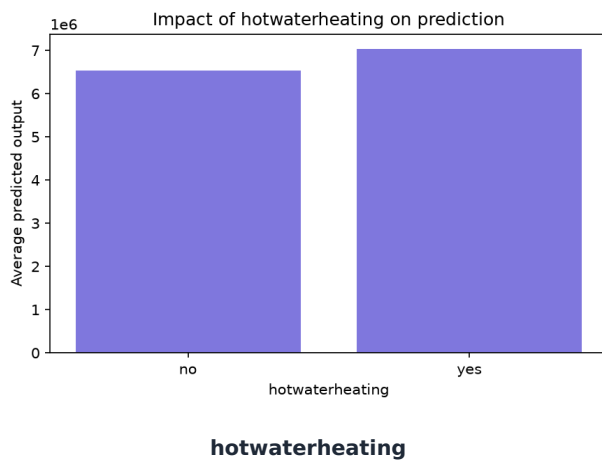

**parking**

**airconditioning**

**mainroad**

These results should be used as a starting point for review and further analysis, rather than a final verdict on the model's performance or predictions.
