

Model Explainability Report

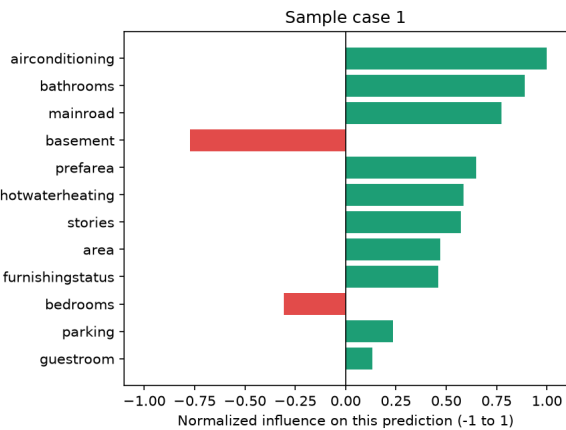

Model tested	House Price - ElasticNet Linear Regression
Endpoint	http://0.0.0.0:8000/house_prices
Task type	regression
Data points analyzed	50
Report generated	2026-09-15 18:30

A sensitivity score shows how strongly each factor influences the model’s output; a higher score means that factor has a bigger effect on the prediction. The sensitivity scores provided are normalized to a 0-1 scale, representing each feature’s share of total measured sensitivity.

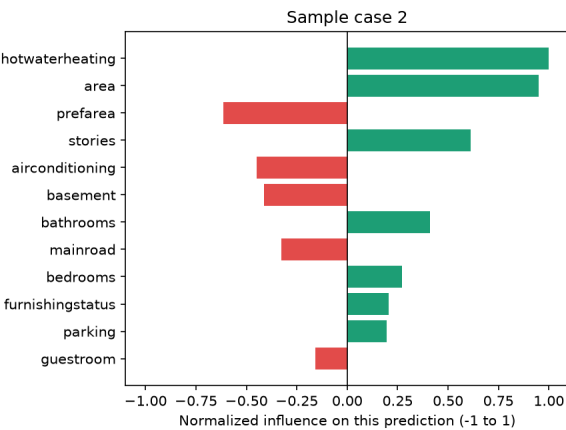

Feature sensitivity

The following examples illustrate specific real scenarios and highlight the most influential factors affecting each prediction.

Input values:

Input values:

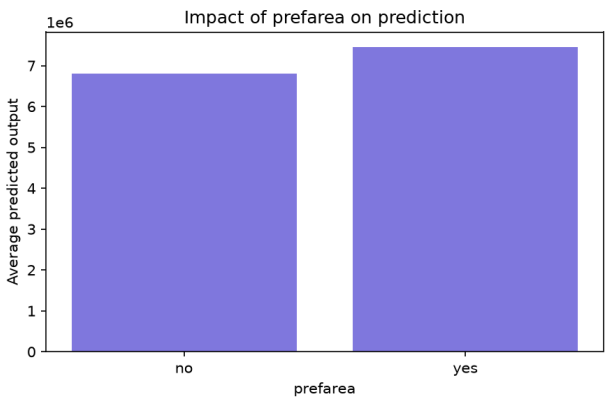

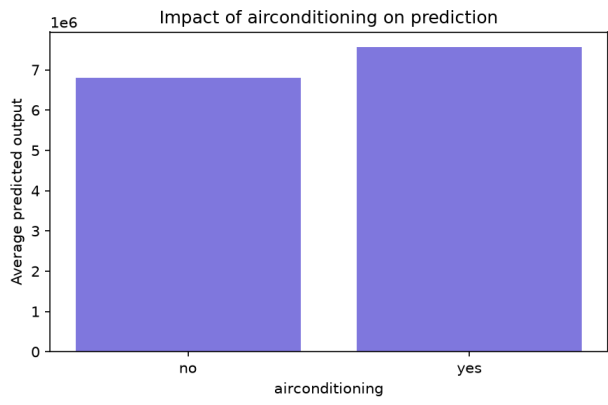

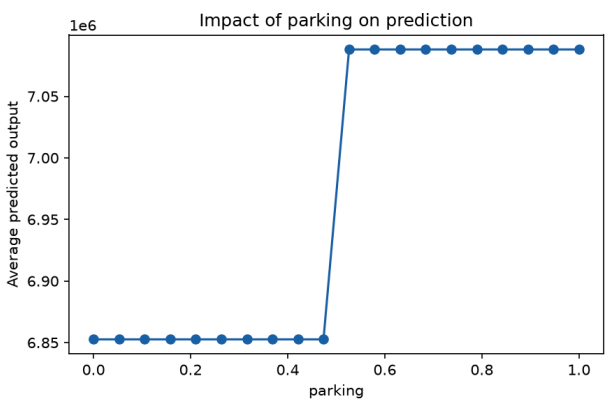

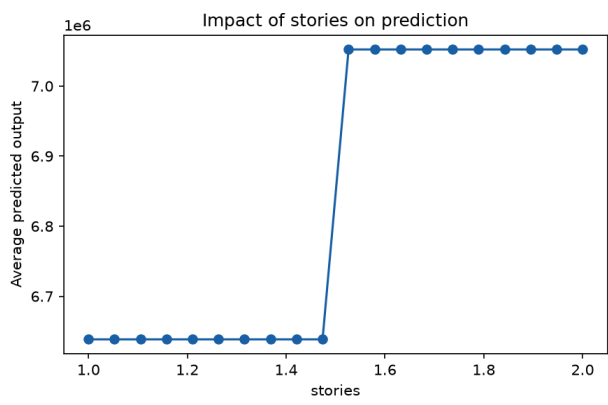

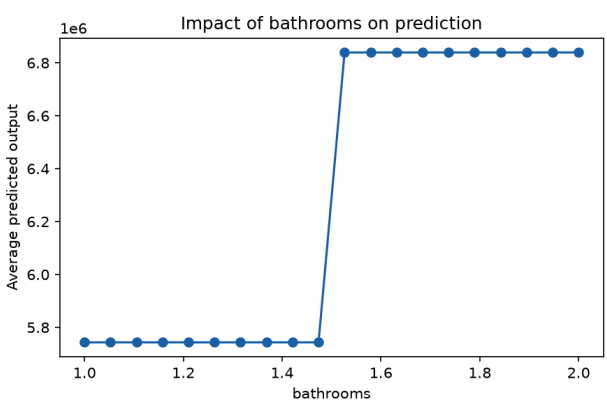

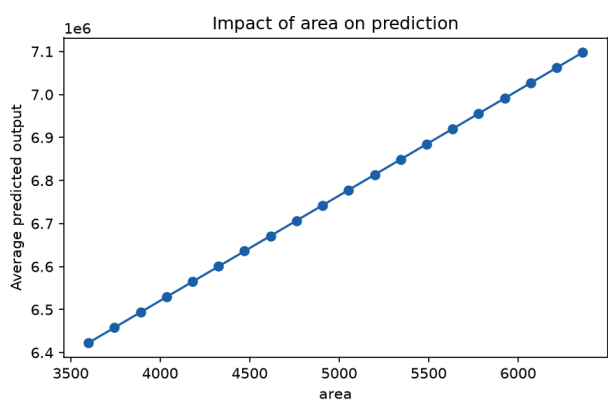

- **area:** 1,892.00
- **bedrooms:** 3.00
- **bathrooms:** 2.00
- **stories:** 2.00
- **parking:** 1.00
- **mainroad:** yes
- **guestroom:** no
- **basement:** no
- **hotwaterheating:** yes
- **airconditioning:** yes
- **prefarea:** yes
- **furnishingstatus:** furnished

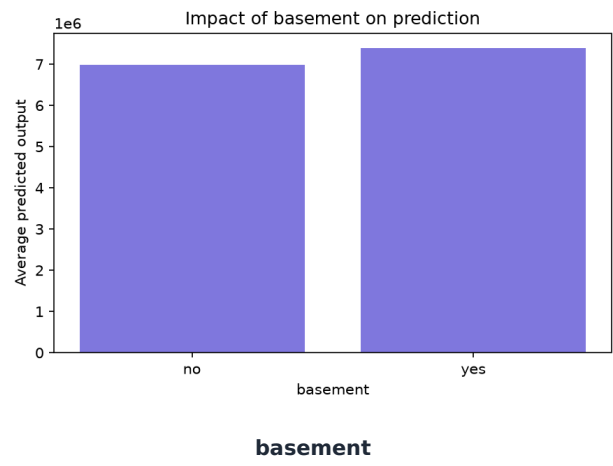

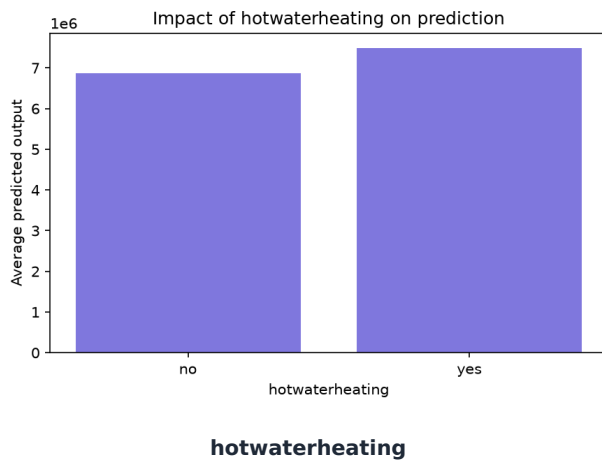

Predicted value: 6,521,283.76

- **area:** 10,250.00
- **bedrooms:** 5.00
- **bathrooms:** 3.00
- **stories:** 3.00
- **parking:** 2.00
- **mainroad:** no
- **guestroom:** yes
- **basement:** no
- **hotwaterheating:** yes
- **airconditioning:** no
- **prefarea:** no
- **furnishingstatus:** semi-furnished

Predicted value: 8,712,898.01

The charts below show how the predicted output changes as each factor varies, while other factors remain typical of the dataset.

These results serve as a starting point for further review and analysis of the model's performance and the factors influencing its predictions.
